

Vue Storefront

Vue Storefront is an frontend framework that can work with any backend API. To learn how to build your integration, see [Kibo's integration guide](#) on the Vue Storefront website.

Try It Out

If you want to demo the integration, you can run the following commands:

```
yarn global add @vue-storefront/cli  
vsf init <project_name> && cd <project_name> && yarn && yarn dev
```

Contribute

This project follows the [all-contributors](#) specification and contributions of any kind are welcome.

Prerequisites

In order to use Vue Storefront, you must have the following:

- NodeJS v14 or later
- KiboCommerce Account

Get Started

To begin development on your own version of the repo:

1. Fork the repo.
2. Clone your fork of the repo: `git clone https://github.com/vuestorefront/kibocommerce.git cd kibocommerce`.
3. Checkout develop branch `git checkout develop`.
4. Run `yarn` to install dependencies.
5. Define a store running environment by adding a `STORE_ENV` to your running project or execute the code `$ echo "STORE_ENV=dev" >> .env`.
6. Copy `config/example.json` to an environment named `config` and update the GraphQL Endpoint: `$ cp packages/theme/config/example.json packages/theme/config/dev.json`.
7. Update the Client ID and Shared Secret with your respective Application Client ID and Shared secret [found in your Developer Console](#).
8. Update `apiHost` to point at your Kibo site.
9. Build dependencies `yarn build:api-client && yarn build:composables`.
10. Run `yarn dev:theme` to run theme. You can find other commands in `package.json`.

If you need HMR on your API client or composables, run `yarn dev:api-client` or `yarn dev:composables` in a separate terminal window.
