

# Order Validators and Fraud Check Applications

An order validator is a way to implement a fraud check. The only Kibo supported order validators are [Kount](#) and [Cybersource DecisionManager](#).

## Add Order Validator

Follow the below steps to add an order validator:

1. In Dev Center, navigate to **Develop > Applications > Packages > Capabilities**.
2. Click **Add Capability**.
3. Search for **Order Validator** in the **Add Capability** modal and click **Ok**.

4. Add a URL for a web service that you host externally, or an API Extension function if you want it hosted in Kibo.

### Order validator

\* ValidateOrder endpoint URL:

This field is required

Cancel

Save

The URL is user-defined and is a REST endpoint that takes a validator request and returns a validator response.

REST API Response

See schema of GET:

[/commerce/orders/{orderId}/validationresults](#)

```
[
  {
    "validationId": "string",
    "validatorName": "string",
    "validatorType": "string", // "Fraud" (only option)
    "status": "string", // "Pass", "Review", or "Fail"
    "createdDate": "2021-06-10T15:38:19.651Z",
    "messages": [
      {
        "orderItemId": "string",
        "messageType": "string",
        "message": "string"
      }
    ]
  }
]
```

Ensure that your messages are formatted correctly to avoid any potential order errors.
