Vercel Commerce

[Vercel Commerce](#) offers a headless B2C e-commerce starter kit using Next.JS commerce. With a few clicks, Next.JS developers can clone, deploy and fully customize their own store. You can start with the default local provider `@vercel/commerce-local` that has all features disabled and uses static files for the backend.

Features

Vercel Commerce supports the following features:

- Performant by default
- SEO Ready
- Internationalization
- Responsive
- UI components
- Theming
- Standardized data hooks
- Integrations (integrates seamlessly with the most common e-commerce platforms, including Kibo)
- Dark mode support

Demo Example

View a live demo of Kibo's Vercel Commerce Storefront [here](#).

Getting Started

Our commitment to Open Source can be found [here](#).

1. Fork [this repository](#) to your own GitHub account and then clone it to your local device.
2. Create a new branch git checkout `-b MY_BRANCH_NAME`.
3. Install the dependencies: `pnpm install`.
4. Build the packages: `pnpm build`.
5. Duplicate `site/.env.template` and rename it to `site/.env.local`.
6. Add proper store values to `site/.env.local`.
7. Run `cd site` & `pnpm dev` to watch for code changes.
8. Run `pnpm turbo run build` to check the build after your changes.
9. The following data is required to configure the storefront.
   - `KIBO_API_Host` : Your Kibo Commerce API Host.

- KIBO_AUTH_HOST : Kibo Commerce Authentication Host Server. It is used to request an access token from the Kibo Commerce OAuth 2.0 service.
- KIBO_CLIENT_ID : Unique Application (Client) ID of your application. This is viewable from your Kibo Dev Center.
- KIBO_SHARED_SECRET : Secret API key used to authenticate your application/client ID.

Visit Kibo documentation for more details on API authentication.
