

# Configure Substitutions

You must first contact [Kibo Support](#) to have this feature enabled in your tenant settings. Then you will be able to proceed with this guide to enable repricing and email notifications, add the substitute attribute to product types, and select the substitutes on products. If you also want to offer shoppers the ability to opt in or out of substitutions, refer to the [Shopper Preferences](#) guide.

## Enable Repricing

Repricing on substitutions is optional. When a reprice occurs, the substitute's item price will be applied but discounts will not be re-evaluated. Any discounts on the original item will be copied to the substitute item as-is. Shipping and handling will be copied from the original item to the substitute item, tax will be refreshed, and the shipment total will be recalculated. Payment may or may not be affected, depending on the difference between the substitute item and original item's pricing:

- If the substitute item's price is lower than the original item, then the difference will be credited to the customer. If [Auto Capture](#) is enabled, then the system will do this automatically as long as a payment has already been captured. If Auto Capture is not enabled, you will have to credit the amount manually.
- If the substitute item's price is higher than the original item, the payment status will be set to Errored and all shipments on the order will be blocked from fulfillment until an additional payment for the difference is authorized. An email notification can be sent to the shopper informing them of this and directing them to Customer Care for more details.
- If the substitute item's price is the same as the original item, there will be no impact to payment.
- In the case of bundled products, pricing is distributed across all items in the bundle before substitutions are made. When repricing is enabled, the substitute item's catalog price will replace the original item's distributed price without affecting other items in the bundle. If repricing was not enabled, then the original item's distributed price would still be applied to the substitute item.

Repricing is disabled by default. To enable repricing on all substitutions:

1. Go to **System > Settings > General > Site**.
2. Locate the **Fulfillment Settings** section.
3. Toggle **Reprice on Substitution**.

## Fulfillment Settings

### Fulfillment

### Substitution

Reprice on Substitution

4. Click **Save**.

## Enable Email Notifications

In order to send optional email notifications to shoppers, enable them under [your email settings](#):

1. Go to **System > Settings > General > Email**.
2. Scroll down to Shipment Emails and toggle on **Substitution - payment required** to send an email notification when the substitute item's price is higher than the original item after repricing. This prompts the customer to provide additional payment before the order can be fulfilled.

### Other

Delivery date updated 

Backorder 

Item cancelled 

Substitution - payment required  

3. Scroll down to Order Emails and toggle on **Item Substituted** to send an email notification when an automatic substitution takes place.
4. Click **Save**.

## Add Attribute to Product Types

Enable substitutions in your catalog using the substitute property in the [product type configurations](#).

1. Go to **System > Schema > Product Types**.
2. Select a product type. All usage types are supported.
3. In the **Properties** tab of the product type settings, select the **Substitute Products** attribute.
  - If the product is a Configurable Product, then substitutes must be set up at the variant

level as each of its product variants has its own product code. In this case, select the **Substitute Variants** attribute instead.

The screenshot shows a 'Properties' dialog box with a list of attributes on the left and configuration options on the right. The 'Substitute Products' attribute is selected and highlighted with a blue border. The configuration options include checkboxes for 'Required by admin', 'Allow Multi select', and 'Hidden from Shopper', a 'Display Group' dropdown, and a 'Storefront Details' dropdown. A green 'Done' button is visible at the bottom right.

4. Click **Done** to add it to the product type.
5. If you want the system to perform automatic substitutions on this product type, also add the **Allow Auto Substitutions** attribute. If this attribute is not added, then substitutions can only be performed manually by fulfillers.

The screenshot shows the 'Properties' dialog box with the 'Allow Auto Substitutions' attribute selected and highlighted with a blue border. The configuration options are the same as in the previous screenshot, but the 'Done' button is highlighted in green.

6. Click **Save**.

## Select Substitutes on Products

After adding the attribute to product types, select any product of that type in your master catalog and set up its substitute(s). Substitutions may be made for any standard products, variant products, product extras, bundles, bundle components, items in collections, and digital items, with the exception of service items.

1. Go to **Main > Catalog > Products**.
2. Click the product that you want to configure substitutes for.
3. In the **Properties** tab of the product settings, enter eligible substitutes in the **Substitute Products** field. If the product usage is Configurable Product with Options, use the **Substitute Variants** field to select eligible variants as substitutes instead.
  - The order in which you add these substitutes will be the order of priority used by

automatic substitutions, from highest to lowest.

Substitute Products

Cheese	x	Cheese Goat	x	Cheese Cheddar	x	Cheese Cream	x	Cheese - Substitutable	x
CH06 - Substitutable	x								

4. If you want to perform automatic substitutions, toggle on **Allow Automatic Substitutions**.

### Allow Auto Substitutions

5. Click **Save** when you have finished adding all desired substitutes to your product.

There is a limit of 10 substitutes per product. If you don't want to use substitutes for a particular product, then you do not have to select any in its product configurations (even if it belongs to a product type enabled for substitutions).
