

May 13, 2025 — 1.2518 Service Update

Announcement: FFUI Dashboard and Returns

In 2024, Kibo made a new version of [the Fulfiller UI dashboard](#) available for enablement, which also enables you to implement [Fulfillment SLAs](#) if you want to use them. Another update in which the [Admin UI's return dashboard](#) is embedded within the [Fulfiller UI](#) was added to sandboxes as of Version 1.2510, giving fulfillers more robust return management.

As of April 30, both of these updates are enabled in all sandbox environments. Please begin testing these features. They will be deployed to production tenants on May 27, at which point all Fulfiller UI users will see the updated interfaces. Please contact if you have any questions.

Production Tenant Features

This production release is being postponed by two weeks, meaning that the updates listed here will be pushed to production tenants alongside the new sandbox updates on Tuesday, May 27.

Catalog

- **Rules Performance Enhancement:** When accessing product rules for [Return Rules](#), [Safety Stock Rules](#), and [Purchase Limit Rules](#), the data will now load faster.

Fulfillment

- **Digital Shipment Update:** [Digital shipments](#) will now be marked as Fulfilled when their order is moved to the Accepted status, instead of immediately upon order creation.
- **Shipment API Extensions:** New [before and after API extensions](#) have been added that can interact with the Get Shipment and Get Shipments APIs. This allows you to leverage custom tasks such as rewriting shipments to display a total bundled quantity instead of the individual quantities within a bundle.

Production Bug Fixes

Service	Resolution
Commerce	A "shipment expected delivery date is not aligned with items expected delivery date" error was experienced on some implementations when creating shipments with estimated delivery dates. This has been corrected so that dates are set on the shipment items as intended, and shipments are split appropriately based on the full estimated date-time (instead of only the date).

Service	Resolution
Fulfillment	Users without the "Report Read" behavior were unable to access Fulfillment APIs. This has been updated so that this behavior is no longer required.
Fulfillment	The pick wave link was not appearing in the Fulfiller UI's navigation menu after the most recent release. This has been fixed so that pick waves are accessible as expected.
Order Routing	Some null errors were experienced when retrieving newly created locations' fulfillment capacities for Order Routing. This has been fixed so that these location capacities can be successfully accessed.

Production Sandbox Features

Catalog

- **Category IDs in Google Feed**: Additional category data related to Category IDs, such as those of parent product categories, are now included in Google Feed exports.
- **Dynamic Category Expression Update**: When configuring [dynamic category expressions](#) via the UI, the `productName` field now supports using CONTAINS.

Commerce

- **Custom Returns Error Message**: If an error message is specified via the [returns.actions.before](#) API Extension (using `throw new Error('MESSAGE HERE')`), then the custom text will now be displayed on the Admin UI's error notification banner when triggered.

Fulfillment

- **Partial Consolidation Fulfillment**: When an [STH](#) or [Delivery consolidation](#) shipment contains both available items and items awaiting transfer, you can now fulfill the available items right away. Once enabled in your consolidation site settings ("Allow Partial Fulfillment"), call the POST `.../api/commerce/shipments//itemsReadyForPack` API endpoint with a list of line item quantities, such as in the below example. This will move those items to a new shipment that can immediately continue with fulfillment. The transfer items will remain in the original Waiting for Transfer shipment until they arrive and can be fulfilled. The ability to do this through the Fulfiller UI instead of an API call will be added in a future release.

```
{
  "items": [
    {
      "lineId": 1,
      "quantity": 2
    },
    {
      "lineId": 2,
      "quantity": 1
    }
  ]
}
```

Sandbox Bug Fixes

Service	Resolution
Catalog	Shipping subtotals were not being returned in priced orders when set to ship via flat rate shipping. This has been fixed so that order pricing always includes the appropriate shipping subtotal.
Catalog	Dragging and dropping member products within a collection didn't always generate the associated API call, meaning that deleted products sometimes were not removed from the collection. This has been corrected so that adjusting collection products retains updates as expected.
Catalog	The "Minimum Category Purchase Amount" setting didn't allow a value higher than \$999.99, in which case it would automatically alter the value to fit. This has been updated so that you can successfully a higher minimum purchase value.
Commerce	The Get Login State API did not always update with the accurate latest login date. This has been fixed so that the login history is more accurately tracked.
Commerce	Order attributes were not being populated in the return data for some orders. This has been corrected so that returns going forward will always retain their attributes, though past returns will require that information to be retrieved via the corresponding order items instead.
Fulfillment	Importing historical orders triggered shipment events, which were not necessary for past completed orders. This process has been updated so that fulfillment events will not be erroneously generated by historical order imports.
